

# Laboratory Assignment #10

## Simplified Super Store: The Networked Version with TCP

To solidify our networking skills, this lab is designed to be a simplified version of the previous lab assignment. The instructions are below:

There will be a single client & a server, communicating with each other.

There will be a single .csv file which the server is going to try and parse. This .csv file can be found alongside this document in Blackboard.

The server will calculate the average price of all products. After completing the calculations, the server will send the result to the client.

The client, upon receiving the result, will send a success message (arbitrary, could be anything) back to the server, display the result on its end, and quit.

The server will listen for the success message and will also quit upon receiving such a message.
